

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (currently amended) In a communication system comprising at least a first and second simulcast station at a first remote site, a method comprising:

~~detecting, by a simulcast site controller, unavailability of the first simulcast station for communicating on a first communication resource by at least one of a) receiving a message from the first simulcast station that the first simulcast station has a malfunction and b) not receiving a response when a message is sent to the first simulcast station;~~

determining, by a simulcast site controller, if the second simulcast station is available for supporting simulcast transmissions on the first communication resource; and

if the second simulcast station is available, assigning, by a simulcast site controller, the second simulcast station to communicate on the first communication resource, ~~sending, by a comparator, data to be communicated over the simulcast channel to one or more of the simulcast stations along with a timestamp specifying when the data will be transmitted, and communicating, by the second simulcast station, simulcast messages on the first communication resource, and~~

~~wherein the communication system further comprises a plurality of simulcast stations distributed among a plurality of remote sites and where a subset of the plurality of simulcast stations communicates on the first communication resource and wherein the controller, comparator and simulcast stations are connected by an Internet Protocol network and the simulcast stations that communicate on the first communication resource share a multicast Internet Protocol address.~~

2. (cancelled)

3. (cancelled)

4. (currently amended) The method of claim 31 wherein the step of detecting is accomplished by the simulcast site controller failing to receive a response to a message sent to the first simulcast station.

5. (cancelled)

6. (currently amended) The method of claim 51 wherein the step of detecting is further accomplished by the first simulcast station notifying the comparator of a malfunction and the comparator notifying the simulcast site controller of the malfunction.

7. (currently amended) The method of claim 51 wherein the step of detecting is further accomplished by the comparator notifying the simulcast site controller of a failure of the comparator to receive a response from a message sent by the comparator to the first simulcast station.

8. (cancelled)

9. (currently amended) The method of claim 81 wherein the step of assigning is accomplished by sending an Internet Protocol packet to the second simulcast station containing the multicast Internet Protocol address of the simulcast stations that communicate on the first communication resource.

10. (currently amended) The method of claim 81 further comprising the step of sending, by the simulcast site controller, an Internet Protocol packet instructing the first simulcast station to shut down.

11. (currently amended) The method of claim 51 wherein the unavailability of the first simulcast station is due to a problem with the connection between the first simulcast station and the comparator.

12. (currently amended) The method of claim 31 wherein the communication system further comprises a third and fourth simulcast station at a second remote site, the method further comprising:

detecting, by the simulcast site controller, the unavailability of the third simulcast station communicating on the first communication resource at the second remote site;

determining, by the simulcast site controller, if the fourth simulcast station is available for supporting simulcast communication on the first communication resource and, if the fourth simulcast station is available;

assigning, by the simulcast site controller, the fourth simulcast station to communicate on the first communication resource; and

communicating, by the fourth simulcast station, simulcast messages on the first communication resource.

13. (currently amended) The method of claim 1 wherein the unavailability of the first simulcast station is due to a malfunction of the first simulcast station.

14. (currently amended) ~~In a wireless communication system employing simulcast communication, a method for initiating simulcast communication in a simulcast site, the simulcast site comprising a plurality of remote sites, the method comprising:~~ The method of claim 1 further comprising:

~~determining availability of a plurality of simulcast stations located at the plurality of remote sites by detecting unavailability of a simulcast station by at least one of a) receiving a message from the simulcast station that the simulcast station has a malfunction and b) not receiving a response when a message is sent to the simulcast station;~~

assigning, by a simulcast site controller, members of a first simulcast channel, the members comprising respective first-available simulcast stations at each of the remote sites; and

performing simulcast communication using the first simulcast channel.

15. (original) The method of claim 14 wherein the first simulcast channel is used for communication of control information.

16. (original) The method of claim 14 further comprising:
assigning, by the simulcast site controller, members of a second simulcast channel, the
members comprising respective second-available simulcast stations at each of the remote sites;
and
commencing simulcast communication using the second simulcast channel.

17. (original) The method of claim 16 wherein the second simulcast channel is a
payload channel.

18. (cancelled)

19. (cancelled)

20. (new) In a communication system comprising at least a first and second
simulcast station at a first remote site, a method comprising:

detecting, by a simulcast site controller, unavailability of the first simulcast station for
communicating on a first communication resource by the first simulcast station notifying the
comparator of a malfunction and the comparator notifying the simulcast site controller of the
malfunction;

determining, by a simulcast site controller, if the second simulcast station is available for
supporting simulcast transmissions on the first communication resource; and

if the second simulcast station is available, assigning, by a simulcast site controller, the
second simulcast station to communicate on the first communication resource, sending, by a
comparator, data to be communicated over the simulcast channel to one or more of the simulcast
stations along with a timestamp specifying when the data will be transmitted, and
communicating, by the second simulcast station, simulcast messages on the first communication
resource.

21. (new) The method of claim 20 further comprising the step of sending, by the
simulcast site controller, an Internet Protocol packet instructing the first simulcast station to shut
down.

22. (new) The method of claim 20 further comprising:
determining availability of a plurality of simulcast stations located at the plurality of remote sites;
assigning, by a simulcast site controller, members of a first simulcast channel, the members comprising respective first-available simulcast stations at each of the remote sites; and
performing simulcast communication using the first simulcast channel.

23. (new) In a communication system comprising at least a first and second simulcast station at a first remote site, a method comprising:
detecting, by a simulcast site controller, unavailability of the first simulcast station for communicating on a first communication resource, wherein the unavailability of the first simulcast station is due to a problem with a connection between the first simulcast station and a comparator;
determining, by a simulcast site controller, if the second simulcast station is available for supporting simulcast transmissions on the first communication resource; and
if the second simulcast station is available, assigning, by a simulcast site controller, the second simulcast station to communicate on the first communication resource, sending, by a comparator, data to be communicated over the simulcast channel to one or more of the simulcast stations along with a timestamp specifying when the data will be transmitted, and
communicating, by the second simulcast station, simulcast messages on the first communication resource.

24. (new) The method of claim 23 further comprising the step of sending, by the simulcast site controller, an Internet Protocol packet instructing the first simulcast station to shut down.

25. (new) The method of claim 23 further comprising:
determining availability of a plurality of simulcast stations located at the plurality of
remote sites;
assigning, by a simulcast site controller, members of a first simulcast channel, the
members comprising respective first-available simulcast stations at each of the remote sites; and
performing simulcast communication using the first simulcast channel.
